

PROFILE-BASED SEQUENTIAL SELECTION

1 Assess graph

Profile s ; statistics g

Local scope

Isolated nodes
Redundant triples

Graph scope

Empty fields / loops
Invalid relations
Hierarchy-rule flags

Source scope

Unsupported values
Source-match rate

Trial evaluation criteria

Feasibility

Restoration bounds
Density / edit guards

Quality gain

Profile change
Hard-violation reduction

Utility terms

Edit cost, scope prior
and confidence

2

Profile-conditioned routing

$$(p_{\text{repair}}, \pi) = f_{\phi}([s; g])$$

Proceed for a high trigger, hard violation, or supplied candidate

Local prior / Graph prior / Source prior
Stop early only when no candidate needs evaluation

3

Construct candidate edits

Fixed model proposals

One edit bundle per relation

Rule proposals

Violations + explicit source fields

Delete

Retype

Add

Fixed costs: delete 0.30 > retype 0.16 > add 0.06

5

Commit one edit

Updated graph
+ decision log

4

Trial + select

Evaluate all
candidate trial graphs

Keep feasible edits
with positive utility

Select highest utility

None eligible:
stop; keep current graph

bounds + utility

Reassess the accepted graph; repeat within the iteration limit

Without candidates: stop for a low trigger without hard violations, or no detected violations;

OR no feasible positive-utility edit, OR iteration limit reached.
